Attn: Mr. Glenn Clancy, Director

Subject: Belmont, Massachusetts
Storm Water Sampling and Analysis Program
Wellington Brook Tributary Area

Dear Mr. Clancy:

This report outlines Fay, Spofford & Thorndike's (FST) storm water sampling and analysis program in areas tributary to Wellington Brook. The purpose of the program was to identify sections of storm drain containing potential illicit connections (i.e. sources of contamination entering the storm water drainage system).

Study Area

The Wellington Brook runs northeasterly through Belmont, discharging into Clay Pit Pond. Clay Pit Pond discharges to Blair Pond and ultimately the Alewife Brook and Mystic River. Wellington Brook is culverted along most of its length with only a small day-lighted section from Common Street to the Belmont Public Library. The sampling program included all of Wellington Brook and the Clay Pit Pond discharge culvert to Brighton Street. Approximately 95,000 linear feet (18 miles) of storm drain, ranging in size from 12-inch diameter to a 10' x 4' box culvert, are included in the study area. This area was previously identified as Outfall No. 8 in the "Dry Weather Storm Water Discharge Sampling & Analysis Program" submitted to MADEP and USEPA in June 1999.

Dry Weather Sampling Methodology

Forty-five (45) storm drain connections were identified along the Wellington Brook. Two (2) sets of dry weather samples were collected at each connection (after at least 72 hours in which there was no precipitation and no snowmelt). Samples were analyzed for fecal coliform and all storm drain connections with at least one fecal coliform sample result above the threshold limit of 1000 colonies per 100ml were targeted for further investigation. Large target areas were delineated into smaller sub-areas and further dry weather sampling was conducted at the outlet of each sub-area. Areas that were dry (i.e. no sample collected) or with sample results below the threshold limit were eliminated from further investigation.

Sampling Results

A summary of sampling results is presented in Table 1 and illustrated in Figure 1. A total of 88 samples were taken at 74 locations throughout the Wellington Brook area. Locations with no access (e.g. buried manhole) or if access was unsuccessful (e.g. welded cover) are labeled as CNL (could not locate). These areas will require further investigation. Table 2 categorizes the ranges of fecal coliform sample results with the associated length of storm drain. A copy of the certified laboratory results for all samples is included in Appendix A.

TABLE 2

FECAL COLIFORM per 100mL	LENGTH (LF)
COULD NOT LOCATE	12,454
DRY	42,680
0 - 199	15,465
200 - 999	5,040
1,000 - 4,999	7,408
5,000 - 19,999	4,536
20,000 - 29,999	3,063
30,000 +	4,622

Review of Figure 1 shows one of the primary areas of concern is tributary to manhole 30D040 on Pearson Rd. (Samples 6/6A - 6I/6I2). This tributary area extends southeast to Slade St. and Brettwood Rd. All sample locations along this tributary line recorded at least one sample that exceeded 10,000 fecal colonies per 100mL.

Recommendations for Illicit Connection Identification

Phase 1 (2001/2002) and Phase 2 (2005) illicit connection investigations determined the combination of closed circuit televised (CCTV) inspection and simultaneous dye-water tracing, of both the sanitary sewer and storm drain in the target areas, to be the most effective method of identifying potential illicit connections. Therefore, it is recommended that this method be implemented in all areas exhibiting storm drain fecal coliform sample results above the threshold limit of 1000 colonies per 100ml.

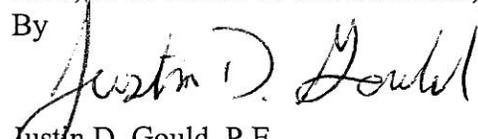

The total length of storm drain and adjacent sanitary sewer above 1000 fecal colonies per 100mL is approximately 19,600 ft and 17,500 ft, respectively (see Figure 2). The estimated cost to conduct cleaning and televised inspection of sanitary and storm drain sewers with concurrent dye testing of portions of the sanitary sewer pipelines and buildings as required to positively identify each illicit connection source and prepare a preliminary design report describing the recommended rehabilitation method and opinion of probable construction cost is **\$130,000**.

Should the Town elect to initially focus on a smaller target area, the total length of storm drain and adjacent sanitary sewer above 5000 fecal colonies per 100mL is approximately 12,200 ft and 11,300 ft, respectively (see Figure 3). The estimated cost to conduct cleaning and televised inspection of sanitary and storm drain sewers with concurrent dye testing of portions of the sanitary sewer pipelines and buildings as required to positively identify each illicit connection source and prepare a preliminary design report describing the recommended rehabilitation method and projected cost for each illicit connection is **\$82,000**.

It is anticipated that the recommended illicit connection identification work can be completed in approximately four months. We are available to meet with you to discuss the findings of this report at any time upon your request.

Very truly yours,
FAY, SPOFFORD & THORNDIKE, LLC.
